1. Introduction

The core processor of DMP-P1 module adopts industrial chip ESP8285. The chip integrates an enhanced version of the Tensilica's L106 Diamond Series 32-bit core processor in smaller size packages. ESP8285 has complete Wi-Fi network function and can be used independently from the controller. Its built-in cache memory greatly provides CPU performance.

- DMP-P1 module supports standard IEEE802.11 b/g/n/e/i protocol and complete TCP/IP protocol stack.
- DMP-P1 module uses built-in Flash, which can make the chip work at - 40 C - 125 C.
- DMP-P1 module has built-in relay control algorithm, which can make its external IO control relay.
- DMP-P1 module has built-in DoHome cloud service and can use DoHome series APP to control switches.
- DMP-P1 module has built-in factory testing program, which can make factory rapid production testing.

5. Power Consumption

Table 5.1 Power Consumption

Parameters	Min	Classical	Max	Unite
Tx802.11b, CCK 11Mbps, POUT=+17dBm	-	170	-	mA
Tx802.11g, OFDM 54 Mbps, POUT =+15dBm	-	140	-	mA
Tx802.11n, MCS7, POUT =+13dBm	-	120	-	mA

Rx 802.11n, 1024 Bytes, -65dBm	-	56	-	mA
Modem-sleep ^①	-	15	-	mA
Light-sleep ^②	-	0.9	-	mA
Deep-sleep ^③	-	20	-	μA
close	-	0.5	-	μA

Note

①: Modem-Sleep mode can be used for the case that CPU is always working, e.g., PWM or I2S etc. If WiFi is connected and no data is to transmitted, in this case, WiFi modem can be closed to save power

energy. For example, if at DTIM3 status, keep asleep at 300ms, Then, the module can wake up to receive the Beacon package within 3ms and the current being 15mA.

②: Light-Sleep mode can used for the case that CUP can stop the application temporally, e.g., Wi-Fi Switch . If Wi-Fi is connected and there is no data packet to transmitted, by the 802.11 standard (e.g., U-APSD), module can close Wi-Fi Modem and stop CPU to save power. For example, at DTIM3, keep up sleeping at 300ms, it would receive the Beacon package from AP after each 3ms, then the whole average current is about 0.9mA.

③ Deep-Sleep mode is applied to the case that Wi-Fi is not necessary to connect all the time, just send a data packet after a long time (e.g., transmit one temperate data each 100s) . it just need 0.3s-1s to connect AP after each 300s, and the whole average current is much smaller 1mA.

6. Wi-Fi RF Characteristics
